

WIRELESS LED INDICATOR ROCKER SWITCH

AutoHot introduces the NEW Wireless LED Indicator Rocker Switch. This wireless activation switch is a momentary contact switch that activates the AutoHot recirculation pump when there is demand for hot water. The switch is powered by AC power in the wall but sends and receives signals to the recirculation pump without the need for running low voltage wiring, saving time and money.

WIRING DIAGRAM

HOW IT WORKS

1. When rocker switch light is off, it means that the pump is off and the hot water line has cooled.
2. Once rocker switch is pressed, the pump turns on and light blinks indicating that hot water is on the way.
3. When hot water reaches the end of the plumbing line, the pump turns off and light stays solidly lit, indicating that hot water is ready.
4. When line cools down, light turns off again.

BENEFITS

- Indicates when pump needs to be activated and when hot water is ready.
- Eliminates the need to run low-voltage wiring.
- Strong wireless range: Up to 1000 ft in open air.
